

Arbitrum One: USDC adapter cycle test, transaction record

Deployer / signer 0x908756f36954f2853134259B8846c49F90E84ECe · 56 transactions, all status = success · blocks 509,739,748–509,794,195 · 2026-09-28 14:56:02 – 2026-09-28 18:48:30 UTC (2026-09-28 20:26 – 2026-09-29 00:18 IST) · total gas fees 0.000406591 ETH

Summary

Purpose. Deposit 4 USDC into the new CoreVault, move it through each of the seven lending adapters of the USDC strategy one at a time (all other adapters disabled), then withdraw.

Result. Every adapter accepted the funds and returned them on recall. 4.000000 USDC deposited; 3.940128 USDC withdrawn (0.059872 USDC, about 1.5%, retained by the vault as deposit and instant-exit fees). Deployer holds 0 vault shares afterwards.

Fund flow. Of the 4 USDC deposit (plus the pre-existing 1 USDC seed), 4.4 USDC went to the strategy and 0.6 USDC stayed in core as ops reserve. The strategy's 50% per-adapter cap meant each adapter held 2.2 USDC per round, with 2.2 USDC idle in the strategy.

Rehearsal. The full sequence was rehearsed on a local Anvil fork of Arbitrum One before any mainnet transaction was sent.

State changes left in place after the test

- StrategyRouter: USDC strategy allowlisted and registered (priority 1, weight 100%).
- CoreVault: unpaused and open to deposits (existing 10M vault / 500k per-user caps).
- EulerUsdcMultiMarketAdapter: capacity changed from 0 to 5e13 (50M USDC), matching the other six adapters.
- All seven adapters enabled, as before the test. Withdrawal parameters restored to 10% instant cap per epoch and 24h deposit lock.
